PROFESSIONAL EXPERIENCE

Copart | *Software Engineer Intern*

May 2025 - Present

- Contribute new features, bug fixes, and performance optimizations for the user-facing Member Platform using Spring Boot and AngularJS, deploying builds with Jenkins to a Kubernetes cluster, improving platform stability
- Set up in-house services including Apache Solr, Kafka, and message queues, and integrate third-party tools such as Scalyr, Datadog, and Grafana, enabling faster issue detection and data access for business teams
- Practicing and implementing efficient Design Patterns for development in Java. Optimized API calls to reduce server response time by 60%.
- Build a scalable AI integration framework that lets users add or edit prompts through the UI or configuration files, simplifying AI feature rollout across the company
- Design and implement a high-throughput data pipeline that ingests and stores large volumes of member events and connects the datastore to Grafana, providing real-time analytics for product teams

Distinction Dev | *Support Engineer / Platform Engineer (Fintech Startup Project)*

Mar 2024 - Aug 2024

- Developed infrastructure, utility packages, and CI/CD pipelines with GitHub Actions and Docker for a UK-based credit-card provider, enabling faster deployments and improved system reliability
- Implemented the Adapter pattern using Inversify in TypeScript to integrate third-party APIs/SDKs such as Salesforce, Mambu, and GoCardless, streamlining integration and reducing code duplication
- Built an interim IaC framework with the AWS SDK and GitHub Actions pipelines to manage legacy Lambda deployments, standardizing deployments and lowering manual effort
- Built a real-time event fan-out platform with AWS Glue schema validation that cut resource consumption by 40%, while streamlining tech debt resolution, improving documentation, and delivering POCs for Solution Architects.
- Established end-to-end test pipelines with Vitest/Jest/Mocha, reducing deployment failures by 80%

Software Developer (Supply Chain Enterprise Project)

May 2023 - Mar 2024

- Helped build a nationwide order and supply chain automation system for a UK home improvement retailer, resulting in faster deliveries and improved tracking for thousands of orders.
- Developed and deployed full-stack applications with Node.js REST APIs on AWS using Serverless Framework Microservices and CloudFormation, boosting processing speed by 70%.
- Implemented business logic in TypeScript, Java (Spring), and Python, optimizing SQL queries with Sequelize ORM and MySQL, reducing query execution time by 60%.
- Built responsive user interfaces with Vue.js, integrated Auth0 for secure authentication, and deployed static assets via S3, Route 53, and CloudFront, which reduced page-load times by roughly 40% and increased front-end availability to 99.9%
- Led client demos and designed system architecture with Lucidchart, resolved technical issues, coordinated cross-team dependencies, and documented interfaces and release processes in Git, which shortened release cycles by two weeks and raised client satisfaction scores

UrbanWeb Solutions | *Flutter Intern*

Dec 2022 - May 2023

- Planned application flow and created Figma prototypes for a steel manufacturer's supply-chain project, which clarified requirements and accelerated the development timeline
- Developed a cross-platform mobile application using Flutter (Dart) and a PHP backend, delivering real-time inventory tracking for the client's supply chain and improving field staff's access to data
- Conducted client demos and led a team of interns, gathering feedback that refined the app's features and secured client approval for the next development phase

EDUCATION

University of Texas - Dallas | *Master's, Computer Science (GPA: 3.934)*

Aug 2024 - May 2026

Gujarat Technological University | *Bachelor's, Computer Engineering (GPA: 9.5)*

Jun 2019 - Jun 2023

SKILLS

Programming: Java, Python, Node.js, TypeScript, Spring Boot, Angular JS, Vue.js, React.js, C/C++, SQL, NoSQL (MongoDB, DynamoDB)

Cloud & DevOps: Microsoft Azure, AWS, Google Cloud Platform, Terraform, Docker, Git, GitHub Actions/ GitLab Workflows

Relevant Tools: Apache Kafka, Apache SOLR, Grafana, Kibana, Elasticsearch, Datadog, ESBuild, Webpack, JIRA, Figma

PROJECTS

Mendy – Personalized Recommendation Engine | <https://github.com/dhyeyshah28801/mendy>

- Built a local item-item collaborative filtering model trained on the Instacart dataset (3M+ orders, 200K+ users) to predict next-purchase items based on historical buying patterns, achieving meaningful accuracy without cloud infrastructure.
- Engineered the full data pipeline from raw transaction logs to ranked recommendations — including co-occurrence matrix construction, similarity scoring, and inference — entirely from scratch without relying on ML frameworks.
- Designed with a modular monorepo architecture (common/, ingestion/, training/, serving/) to cleanly separate concerns and make the system extensible for future model upgrades or dataset swaps.

Sentinel - AI-Powered Log Watchdog for Batch Operations | <https://github.com/dhyeyshah28801/sentinel>

- Built an intelligent log monitoring system that uses Claude AI (via Anthropic API) to continuously analyze batch job logs, detect anomalies such as silent failures, performance degradation, and resource exhaustion, and automatically alert stakeholders via email and Slack
- Architected around a custom MCP (Model Context Protocol) server for log ingestion, a scheduled orchestration layer for periodic analysis, and a React dashboard for real-time job status tracking.
